

ABSTRACT OF THE DISCLOSURE

This invention relates to an image verification apparatus capable of notifying the verifier in an easy-to-understand way of accessory information which
5 may have been altered out of pieces of accessory information recorded in an image data file. An image verification apparatus (20) has a function of verifying whether an image file with an MAC generated by an image sensing apparatus (10A) or an image file with a digital
10 signature generated by an image sensing apparatus (10B) has been altered, and a function of notifying the verifier of the verification result. As for an image file determined as a result of verification to have been altered, the image verification apparatus (20)
15 changes the display form of the accessory information in a list window for the image file.
